In Algebra 1, students solves linear and quadratic equations, and learned how the two processes are based on the same logical principles. In this unit, we extend these processes to solve a greater variety of equations, like rational and radical equations. We learn that we may sometimes get extraneous solutions. We also solve systems that include quadratic equations, and learn how we can use ...

This is how I solve for x. Subtract 4 from both sides and I'm going to get my solutions x=-4 or x=-1. This is how you're going to go about solving quadratic equations by factoring. First get it into factored form, set it equal to zero, and then separate your two factors, make each factor equal to zero and solve for x.

Solving Quadratic Equations by Factoring - Concept ...
Given a general quadratic equation of the form ax²+bx+c=0 with x representing an unknown, a, b and c representing constants with a ? 0, the quadratic formula is: where the plus-minus symbol "±" indicates that the quadratic equation has two solutions.

We could go straight to the quadratic formula from here, but quadratics are always easier to solve if we eliminate Greatest Common Factors first. In

this case the GCF is 4 so let's divide both sides by 4. Now we can compare against the standard form to find a, b, and c. By pattern matching, we see that a = 1, b = -3, and c = 4.
