An algorithm is a finite set of steps defining the solution of a particular problem. An algorithm is expressed in pseudo code – something resembling C language or Pascal, but with some statements in English rather than within the programming language

Example. If the given decimal number is 2545. Step 1: Calculate remainder when 2545 is divided by 16 is 1. Therefore, temp = 1. As temp is less than 10. So, arr [0] = 48 + 1 = 49 = ' 1 '. Step 2: Divide 2545 by 16. New number is 2545/16 = 159. Step 3: Calculate remainder when 159 is divided by 16 is 15.

Given a decimal number as input, we need to write a program to convert the given decimal number into an equivalent octal number. i.e convert the number with base value 10 to base value 8. The base value of a number system determines the number of digits used to represent a numeric value. For example ...

# Get Free Algorithm And Flowchart Convert Decimal To Binary

Algorithms and flowcharts are two different tools used for creating new programs, especially in computer programming. An algorithm is a step-by-step analysis of the process, while a flowchart explains the steps of a program in a graphical way.

Explain Algorithm and Flowchart with Examples

Flow Chart. Flow chart is the pictorial representation of any given task or problem or program. Types of Flow Chart. There are two types of flow charts, given here with its short description: System Flow Charts - These flowcharts describe the logical flow of the process, actually the sequence of events in business that happens before something ...

Great method to convert mentally from decimal to binary. Other methods mentioned works in a reverse order, i.e. when one finishes the division by 2, that last remainder is the 1st digit from left side in the binary number (so difficult to do mentally).
