An autonomous robot is a machine that acts and behaves with a high degree of independence. By definition, robots are at least semi-autonomous meaning that they can react to some events and conditions without need of direction. The term autonomous robot suggests a machine that can accomplish complex objectives without need of external control. The following are illustrative examples.

~~6 Examples of Autonomous Robots - Simplifiable~~

Crucial Components of an Autonomous Robot. The key components to the autonomous action mentioned above include these three key concepts: perception, decision, and actuation. Perception: For people, this is

mostly our five senses. Eyes, ears, skin, hair, and many other biological mechanisms are used to perceive the world. For a robot, perception ...

~~What Are Autonomous Robots? | Waypoint Robotics~~

An autonomous robot, also known as simply an autorobot or autobot, is a robot that performs behaviors or tasks with a high degree of autonomy (without external influence). Autonomous robotics is usually considered to be a subfield of artificial intelligence, robotics, and information engineering. Early versions were proposed and demonstrated by author/inventor David L. Heiserman.

~~Introduction To Autonomous Le Robots Mit Press~~

Autonomous robots are precise and complete almost error-free assignments. The advantage of using autonomous robots is that once they are set, they do not require human input since they work independently. Automotive robots can be autonomous to reduce the interference of the processes. Semiautonomous Robots
