P is the probability of success on any trail. $q = 1 - P$ – the probability of failure. n – the number of trails/experiments. x – the number of successes, it can take the values $0, 1, 2, 3, \dots, n$. $n C x = \frac{n!}{x!(n-x)}$ and denotes the number of combinations of n elements taken x at a time.

Mean and Variance of Binomial Distribution If p is the probability of success and q is the probability of failure in a binomial trial, then the expected number of successes in n trials (i.e. the mean value of the binomial distribution) is $E(X) = \mu = np$ The variance of the binomial distribution is

12. The Binomial Probability Distribution

In this lesson, we will look at how to use the Binomial Theorem to expand binomial expressions. Binomials are expressions that contain two terms such as $(x + y)$ and $(2 - x)$. The Binomial Theorem states that. Note that: 1) The powers of a decreases from n to 0 . 2) The powers of b increases from 0 to n . 3) The powers of a and b always add up to n .
