Keras is the recommended library for beginners, since its lea rning curve is very smooth compared to others, and at the moment it is one of the popular middleware to implement neural networks. Keras is a Python library that provides, in a simple way, the creation of a wide range of Deep Learning models using as backend other libraries such as TensorFlow, Theano or CNTK.

Deep learning is a subfield within machine learning, which in turn is a subfield within artificial intelligence. Artificial intelligence is the art of creating machines that perform functions that require intelligence when performed by people. Machine learning uses algorithms that learn without being explicitly programmed. Deep learning is the subset of machine learning that usesÂ artificialÂ neural networks that mimic how the brain works.

The fundamental difference between a densely connected layer and a specialized layer in the convolution operation, which we will call the convolutional layer, is that the dense layer learns global patterns in its global input space, while the convolutional layers learn local patterns in small windows of two dimensions.
