influence

whether a species will evolve toward semelparity or iteroparity. The effect of offspring care on the evolution of iteroparity is a topic of ongoing research. In a recent study, researchers found that the presence of offspring care can lead to the evolution of iteroparity in species that would otherwise be expected to be semelparous. This is because the cost of producing offspring is reduced when the parent can provide care, leading to a higher net reproductive rate and a longer lifespan.

Explain the effect of offspring care
