The ALP activities of the treated and untreated hFOB cells increased with time and peaked at day 14. Figure 7 shows that the ALP activities in the hFOB 1.19 cells in both treated and untreated cells were significantly increased with a time course (day 7 until day 14). Subsequently, starting on day 7 and onwards, the ALP activity in the hFOB 1.19 cells treated with QI gall extract was significantly higher compared to the other two groups.

Fetal mesenchyme-derived factors are likely to play an important role in pancreatic islet development and growth. We have used primary cultures of human fetal pancreatic tissue to identify growth factors that have morphogenic, mitogenic, and insulinotropic activity. The formation of islet-like cell clusters (ICCs) during a 6-day culture was stimulated two- to threefold by hepatocyte growth ...
