Interpreting LISP: Programming and Data Structures, Second Edition now with O'Reilly online learning. O'Reilly members experience live online training, plus books, videos, and digital content from 200+ publishers.

Interpreting LISP:

Lisp Programming and Data Structures, Second ...

Introduction. Learn Lisp programming in a data structures context, including tables, functions, forms, expressions, typed-pointers, I/O, garbage collection and some applications. This short primer contains

a careful description of the data structures manipulated by Lisp functions. These data structures and others, notably hash tables, are also used in constructing a Lisp interpreter.

Interpreting LISP | SpringerLink

The first Lisp interpreter was

implemented by McCarthy with the help of colleagues and students in the Artificial Intelligence Group of the MIT Research Laboratory of Electronics and in the MIT Computation Center. 1 Lisp, whose name is an acronym for LISt Processing, was designed to provide symbol-

manipulating capabilities for attacking programming problems such as the symbolic differentiation and integration of algebraic expressions. It included for this purpose new data objects known as ...

Programming in Lisp - Structure and Interpretation of ...

Interpreting Lisp will be of special interest to those learning and using programming languages and computer architecture as well as data structures. This book will be useful to autodidacts, professional

programmers, and computer enthusiasts in a wide variety of fields. What You'll Learn. Use the atom table and the number table in Lisp

Structure and Interpretation of

**Computer Programs,
2nd ed.**

Common Lisp is a
general-purpose
programming
language and thus
has a large language
standard including
many built-in data
types, functions,
macros and other
language elements,
and an object system
(Common Lisp Object

System). Common Lisp also borrowed certain features from Scheme such as lexical scoping and lexical closures.

Lisp (programming language) - Wikipedia

An example is whether a closure in a Lisp-like language is implemented using

closures in the interpreter language or implemented "manually" with a data structure explicitly storing the environment. The more features implemented by the same feature in the host language, the less control the programmer of the interpreter has; a

different behavior for dealing with number overflows cannot be realized if the arithmetic operations are delegated to corresponding operations in the host language.
