Lab 5 Cellular Respiration. Introduction Cellular respiration is the procedure of changing the chemical energy of organic molecules into a type that can be used by organisms. Glucose may be oxidized completely if an adequate amount of oxygen is present. Equation For Cellular Respiration. C₆H₁₂O₆ + 6O₂ -> 6CO₂ + 6H₂O + energy

Lab 5 Cellular Respiration. Define the following terms: Cellular respiration (aerobic respiration) (2 points) Fermentation (anaerobic respiration) (2 points) Summarize what occurs during the three steps of cellular respiration and indicate where each process takes place in the cell. (6 points) Glycolysis. Krebs cycle. Oxidative phosphorylation.

Lab 5 Cellular Respiration – nursingassignment.org
The overall equation of aerobic cellular respiration is: CH₂O + 6O₂CO₂ + 6H₂O + 38 ATP (maximum) We can measure the rate of cellular respiration by measuring the consumption of the reactants (glucose or oxygen), or by measuring the rate of production of the end products (carbon dioxide or water) of this process.

Cellular respiration is the release of energy from organic compounds by metabolic chemical oxidation in the mitochondria in each cell. Cellular respiration involves a number of enzyme mediated reactions. The equation for the oxidation glucose is C₆H₁₂O₆ + O₂ à CO₂ + H₂O + 686 kilocalories per mole of glucose oxidized. There are three ways cellular respiration could be measured. The consumption of O₂ (how many moles of O₂ are consumed in cellular respiration).

Cellular respiration occurs in most cells of both plants and animals. It takes place in the mitochondria, where energy from nutrients converts ADP to ATP. ATP is used for all cellular activities that require energy. In this laboratory, you will observe evidence for respiration in pea seeds and investigate the effect of temperature on the rate of respiration.
