Bookmark File PDF Ligand Field Theory And Its

Ligand field theory describes the bonding, orbital arrangement, and other characteristics of coordination complexes. It represents an application of molecular orbital theory to transition metal complexes. A transition metal ion has nine valence atomic orbitals - consisting of five nd , one s , and three p orbitals. These orbitals are of

Relating the Colors of Coordination
Complexes to the Spectrochemical Series
According to the Crystal Field Theory,
ligands that have high spin are considered
"weak field" and ligands that have low spin
are considered "strong field." This relates to
the colors seen in a coordination complex.
