Biology - McGraw Hill

The set of reactions that use oxygen as the ultimate electron acceptor to produce adenosine triphosphate (ATP), generate heat, generate electrochemical gradients, and/or perform oxygen-dependent metabolic transformations. It is incorrect to equate cellular respiration (Fig. 1) with production of ATP (a vital energy compound in living cells) because some processes that produce ATP do not use oxygen and because some processes that use oxygen do not generate ATP.

Molecules / Glycolysis / Cellular Respiration -Glucose is split into two three-carbon pieces by glycolysis, which are further decomposed in the Kreb's cycle during cellular respiration. -Pyruvate is the end product of glycolysis and is decarboxylated to acetyl coA to be fed into cellular respiration. -Oxygen is not used in glycolysis but is the terminal electron acceptor for cellular respiration.
