Open reduction internal fixation (ORIF) is a surgery to fix severely broken bones. It's only used for serious fractures that can't be treated with a cast or splint. These injuries are usually...

~~ORIF Surgery: Open Reduction Internal Fixation for Broken ...~~

Open reduction internal fixation or ORIF is a method of surgically repairing a fractured bone. Generally, this involves either the use of plates and screws or an intramedullary (IM) rod to stabilise the bone. How is ORIF carried out? There are two separate components to an ORIF procedure.

~~Open Reduction Internal Fixation (ORIF) | BMI Healthcare UK~~

An open reduction and internal fixation (ORIF) puts pieces of a broken bone into place using surgery. Screws, plates, sutures, or rods are used to hold the broken bone together.

~~Open Reduction and Internal Fixation Surgery | Winchester ...~~

"Open reduction" implies that broken bone is being realigned using surgery (as opposed to a closed reduction performed without surgery). "Internal fixation" refers to the hardware used to ensure that the bone is stabilized and held in place so that it is able to heal.

~~Repairing Serious Bone Fracture With ORIF Surgery~~

The purpose of this retrospective study was to analyze the functional results following open reduction and internal fixation of fractures of the radial head and to determine which fracture patterns are most amenable to this treatment.

~~Open Reduction and Internal Fixation of Fractures of the ...~~

Open reduction means surgery is necessary to reorient the bone fracture into the normal position. Internal fixation refers to the hardware such as metal pins, steel rods, screws, or plates used to keep the bone fracture stable in order to heal the right way and to help prevent infection.

~~ORIF (Open Reduction Internal Fixation) Surgery Procedure ...~~

Abstract The purpose of this study was to compare outcomes of open reduction and internal fixation (ORIF) versus closed reduction (CR) for mandibular condylar fractures.

~~Open reduction and internal fixation of mandibular ...~~

Open reduction and internal fixation (ORIF) is a type of surgery used to stabilize and heal a broken bone. You might need this procedure to treat your broken shin bone (tibia) or your fibula. The tibia, or shin bone, is the larger bone in your lower leg. Beside it, more toward the outside of the leg, is the fibula.

~~Tibia/Fibula Fracture Open Reduction and Internal Fixation ...~~

Open reduction with internal fixation (ORIF) remains the basis by which most pilon fractures are operatively stabilized.

~~Open Reduction and Internal Fixation of the Pilon ...~~

Open Reduction Internal Fixation (ORIF) involves the implementation of implants to guide the healing process of a bone, as well as the open reduction, or setting, of the bone. Open reduction refers to open surgery to set bones, as is necessary for some fractures.

~~Internal fixation - Wikipedia~~

Open reduction and internal fixation is a type of surgical procedure used to fix broken bones. It is mainly used on serious fractures that are not treatable with a cast/splint. Often these are injuries that involve the joint or where the fracture is unstable.

~~Open Reduction with Internal Fixation Treatment | OneWellbeck~~

These injuries are associated with long-term disability from subsequent painful osteoarthritis and residual deformity. This study evaluated whether performing a primary arthrodesis (PA) resulted in improved functional outcome and fewer subsequent surgeries as compared to primary open reduction and internal fixation (PORIF).

~~Open reduction internal fixation versus primary ...~~

The following are risks and potential complications of open reduction and internal fixation (ORIF) surgery: Risks associated with any surgery: Bleeding that would require a blood

transfusion; Infection; Allergic reaction to anesthesia; Risks associated with ORIF: Nerve damage that reduces feeling in the arm or leg

~~What are risks and potential complications of ORIF surgery ...~~

The indications for open reduction and internal fixation (ORIF) of femoral neck fractures continue to expand. It is important to distinguish between low-energy fragility fractures in elderly patients and younger patients with high-energy femoral neck fractures since the approach to treatment and methods of fixation vary.

~~Femoral Neck Fractures: Open Reduction Internal Fixation ...~~

Many orthopaedic trauma surgeons would agree that acceptable methods to treat a disrupted anterior pelvic ring fracture include nonoperative care, external fixation, internal spanning fixators, intramedullary superior ramus screws, and open reduction internal fixation.

~~Indications for Open Reduction Internal Fixation of ...~~

An Open Reduction Internal Fixation (ORIF) refers to a surgical procedure to fix a severe bone fracture, or break. "Open reduction" means surgery is needed to realign the bone fracture into the normal position.

~~What is Open Reduction Internal Fixation? (with pictures)~~

Aftercare following open reduction and internal fixation of Le Fort I and palatoalveolar fractures. Postoperative positioning. Keeping the patient's head in an upright position both preoperatively and postoperatively may significantly improve periorbital edema and pain. Medication.

~~Open reduction internal fixation for Le Fort I, edentulous ...~~

Modalities of treatment for open reduction internal fixation (ORIF) are controversial. With most options for treatment, the surgeon should plan on placing arch bars and using MMF. Depending on the nature of the fracture, the surgeon may or may not choose to leave the patient in MMF for a period of time postoperatively.
