Kirk (emeritus, electrical engineering, San Jos State U.) introduces optimal control theory, which "has as its objective the maximization of the return from, or the minimization of the cost of, the operation of physical, social, and economic processes." He concentrates on dynamic

In optimal control theory, the variable tis called the costate variable. Following the standard interpretation of Lagrange multipliers, at its optimal value tis equal to the marginal value of relaxing the constraint.

Using ideas from optimal control theory, the problem of uniqueness is investigated and a number of results (well known from optimal control) are established in the present context.

Optimal control theory is a branch of mathematical optimization that deals with finding a control for a dynamical system over a period of time such that an objective function is optimized. It has numerous applications in both science and engineering.
