Web/Digital: DPI doesn't equate to digital it's a print measure. It was commonly believed for a long that 72dpi was ideal for the web.

~~Understanding DPI,
Resolution and Print vs. Web
Images~~

Print resolution is measured in dots per inch (or "DPI") which means the number of dots of ink per inch that a printer deposits on a piece of paper. So, 300 DPI means that a printer will output 300 tiny dots of ink to fill every inch of the print. 300 DPI is the standard print resolution for high

resolution output.

~~Image Resolution and DPI
Explained~~

~~Largeprinting.com~~

In printing, DPI (dots per inch) refers to the output resolution of a printer or imagesetter, and PPI (pixels per inch) refers to the input resolution of a photograph or image. DPI refers to the physical dot density of an image when it is reproduced as a real physical entity, for example printed onto paper. A digitally stored image has no inherent physical dimensions, measured in inches or centimeters.

A 600 dpi printer squeezes 600 dots horizontally and 600 dots vertically in every square inch of the sheet.

Some inkjet printers have a higher resolution in one direction, so you might also see a resolution like 600 by 1200 dpi. Up to a point, the higher the resolution, the crisper the image on the sheet. uanjo6560 / Pixabay

The DPI value is read by some devices (such as printers) to determine how your image should be presented on a medium (such as paper). For example, a printing shop may request that a photo is submitted with 300 DPI rather than 72 DPI. The printer would then output a larger number of dots for every inch, resulting in a sharper image.

With a pixel dimension of 600 x 600 and a resolution of 300 DPI, the image has a physical size of 2" x 2". The resolution setting is crucial when you want to print. A 1600 pixel x 1200 pixel image printed at 72 ppi, for example, would output at over 22" x 16".

Most flatbed scanners have a true hardware resolution of at least 300x300 dots per inch (dpi). The scanner's dpi is determined by the number of sensors in a single row (x-direction sampling rate) of the CCD or CIS array by the precision of the stepper motor (y-direction sampling rate).
