Each nucleotide is made of three parts: a phosphate group, a five-carbon sugar molecule, and a nitrogen-containing base. The five-carbon sugar in DNA nucleotides is called deoxyribose. The nitrogen base in a nucleotide can be either a bulky, double-ring purine, or a smaller, single-ring pyrimidine.

# Read Book Structure Of Dna Power Notes Answers

As proposed by Watson and Crick, deoxyribonucleic acid (DNA) consists of two long nucleotide chains. The two nucleotide chains twist around one another to form a double helix, a shape resembling a spiral staircase. Weak chemical bonds between the chains hold the two chains of nucleotides to one another. A nucleotide in the DNA chain consists of three parts: a nitrogenous base, a phosphate group, and a molecule of deoxyribose.

Antiparallel Double Helix. Double Helix Model - developed by Watson and Crick. DNA molecule made up of 2 connected chains of nucleotides forming a ladder-like structure. Side of ladder are made of alternating phosphate and deoxyribose molecules. Rung of ladder made up of pair of nitrogen bases bonded by hydrogen bonds.

## *DNA and DNA Replication - Notes - Biology | Mrs. McComas*

D. Watson and Crick put it all together to solve the structure of DNA in 1953 IV. The structure of DNA A. Important features of the DNA structure: 1. Right-handed double helix 2. The helices are antiparallel 3. Each helix has a series of nucleotides held together with phosphodiester bonds between the OH groups in two adjacent sugar residues. 4.

## *Chapter 11 Lecture Notes: The Structure of DNA*

DNA is composed of four types of nucleotides. Since the 1920s, scientists have known that the DNA molecule is a very long polymer, or chain of repeating units. The small units, or monomers, that make up DNA are called nucleotides(NOO-klee-oh-TYDZ). Each nucleotide has three parts.

# Read Book Structure Of Dna Power Notes Answers

The Structure of DNA. DNA (Deoxyribonucleic Acid) is composed of two Polynucleotide Strands (the polymers of nucleotides ), which form what looks like a ladder. The Nitrogenous Bases in DNA store the instructions for making polypeptide chains, essentially coding for every feature of the entire organism. The two polynucleotide strands run ' antiparallel ' to each other, with Nitrogenous Bases projecting inwards.

## *The Structure of DNA | A Level Notes*

shape of a double helix. made of repeating subunits called nucleotides. Gene- a segment of DNA that codes for a protein, which in turn codes for a trait (skin tone, eye color..etc), a gene is a stretch of DNA. Nucleotide- consists of a sugar, phosphate and a base. Nucleotides (also called Bases) Adenine, Thymine, , Guanine, Cytosine or A, T, G, C.

## *DNA - Biology Corner*

Nucleosome is a structure formed when DNA is packed around proteins. It has a core around which the DNA fiber is wound in turns. Histone proteins are rich in basic amino acids like arginine and lysine. These amino acids carry positive charges.
