Trophic cascade, an ecological phenomenon triggered by the addition or removal of top predators and involving reciprocal changes in the relative populations of predator and prey through a food chain. A trophic cascade often results in dramatic changes in ecosystem structure and nutrient cycling.

John Terborgh and James A. Estes have sought to reinforce and solidify the argument for top-down control with their book, Trophic Cascades: Predators, Prey and the Changing Dynamics of Nature. This collection of chapters by leading scientists with either aquatic or terrestrial expertise offers convincing evidence for the existence of top-down control and trophic cascades in various habitats.

Trophic cascades--the top-down regulation of ecosystems by predators--are an essential aspect of ecosystem function and well-being. Trophic cascades are often drastically disrupted by human interventions--for example, when wolves and cougars are removed, allowing deer and beaver to become destructive--yet

Trophic Cascades: Predators, Prey, and the Changing ...

Trophic cascades occur when predators limit the density and/or behavior of their prey and thereby enhance survival of the next lower trophic level.

Trophic Cascades Across Diverse Plant Ecosystems | Learn ...

Trophic cascades are powerful indirect interactions that can control entire ecosystems, occurring when a trophic level in a food web is suppressed. For example, a top-down cascade will occur if predators are effective enough in predation to reduce the abundance, or alter the behavior, of their prey, thereby releasing the next lower trophic level from predation (or herbivory if the intermediate ...

Trophic cascade - Wikipedia

We learn from these recent studies that Atlantic cod can affect entire food webs in both the benthic and the pelagic realms. Not only are they strong interactors capable of limiting the abundance of their prey and their prey's prey (i.e., trophic cascade), but also the prey themselves may limit the recovery of this predator.

Apex predators and trophic cascades in large marine ...

The predator pulse lasted a decade during which time cod's prey, herring, declined in abundance, releasing zooplankton from herring predation pressure. The rise in herbivorous zooplankton resulted in a decline in phytoplankton, increasing water clarity during the decade cod were abundant.

Trophic cascades, reciprocal predator-prey effects that alter changes of nonadjacent trophic level, are mostly demonstrated for aboveground ecosystems (Schmitz 2008, Carpenter et al. 2010, Schmitz et al. 2010). In contrast, the role of trophic cascade effects in detrital food webs has been less explored.

Trophic Cascades provides a scientific basis and justification for the idea that large predators and top-down forcing must be considered in conservation strategies, alongside factors such as habitat preservation and invasive species. It is a groundbreaking work for scientists and managers involved with biodiversity conservation and protection.

Studies on trophic cascades originally focused primarily on the indirect effect of predators that are generated by their consumption of prey, but there is a growing number of studies that have found that predator-avoidance behavior of prey is also important to understanding food web dynamics and community structure -.

Trophic cascades are indirect ecological interactions, events in nature that move through multiple trophic levels (remember the food chain or pyramid: vegetation - herbivores - predators, as a simple example); that makes these cascades the ecological equivalent of the well-known 'trickle down' effect in economics.

Wolves and Trophic Cascades | Wolf Park

Once predators become stronger in carrying out predation; they will reduce the numbers or alter the behavior of prey species. This spares the next lower trophic level (the next prey in food chain) from predation. Trophic cascade, as an ecological concept, has stimulated research in various new areas of ecology.

What is Trophic Cascade? Types, Examples | Environment Buddy

Upwards adaptive radiation cascades are characterized by eco-evolutionary interactions between predators and their prey at or around the time of diversification. This is independent of whether diversification is recent or took place anciently.
